HEAT MAP 1 Prefectures within the Pearl River System, highest prices of mid-grade rice. The upper-right quadrant, representing pairings between prefectures in Guizhou and Guangdong, displays the most pronounced shading, indicating that the trend toward market integration is strongest. This result suggests that the market integration effect among prefectures connected through the Pearl River system becomes more pronounced as distance increases. In contrast, neighbouring provinces – such as prefectural pairings between Guizhou and Guangxi, Guangxi and Guangdong, and within individual provinces – exhibit less pronounced integration effects than those observed between Guizhou and Guangdong.

HEAT MAP 2 Prefectures within the Pearl River System, lowest prices of mid-grade rice.

Despite of the similar color distribution, the overall color tone of HEAT MAP 2 is brighter than HEAT MAP 1, suggests that the integration of mid-grade rice lowest prices was not significant as the one of the highest prices. In addition, compare to the other prefectures within Pearl River system, Qingyuan Fu and Sichen Fu, Guangxi province, relatively more strongly integrated with the prefectures of Guangdong and Guangxi provinces, the β values are in between -0.105 and -0.063.

HEAT MAP 3 Prefectures outside the Pearl River System, highest prices of mid-grade rice. The color distribution reveals several patterns of regional integration. (1) First, Renhuai Zhiliding in Guizhou, located at the uppermost reaches, exhibits particularly strong integration with Shiqian Fu and Sizhou Fu in Guizhou; Zhen'an Fu, Taiping Fu and Yulin Zhilizhou in Guangxi; and Lianzhou Fu and Qiongzhou Fu in Guangdong. (2) Zhen'an Fu and Yulin Ting in Guangxi, and Qiongzhou Fu, Chaozhou Fu, and Jiaying Ting in Guangdong display generally strong integration trends with other non-river-system prefectures across the three provinces. (3) The upper-left region, presenting pairs of prefectures within Guizhou, are almost white, implying relatively weak integration trends.

HEAT MAP 4 Prefectures outside the Pearl River System, lowest prices of mid-grade rice.

The color mapping of the mid-grade rice lowest prices of prefecture pairs outside the Pearl River System is similar to the one of the highest prices, implies the integrating patterns of highest and lowest prices are alike. Yet the integrations of Zhen'an Fu, Guangxi province, with other prefectures are less significant than the ones of the highest prices.

HEAT MAP 5 Interactions between Pearl River System and non-river-system prefectures, highest prices of mid-grade rice. Several distinct spatial patterns of integration trends. (1) The upper-right and lower-left quadrants display relatively darker shading, indicating stronger integration trends. The former quadrant represents pairings between river-system prefectures in Guangdong and non-river-system prefectures in Guizhou, and the latter quadrant represents pairings between river-system prefectures in Guizhou and non-river-system prefectures in Guangdong. (2) The upper-left and lower-right quadrants represent, respectively, within-province integration between river-system and non-river-system prefectures in Guizhou and Guangdong. Although the shading is generally lighter than in the upper-right and lower-left quadrants, a substantial number of pairings still display noticeable color intensity, implying a considerable degree of integration between river-system and non-river-system prefectures. (3) From the perspective of river-system prefectures in Guangxi, a conspicuous white region appears in the upper-middle portion of the heat map, indicating that integration between Guangxi river-system prefectures and non-river-system prefectures in Guizhou is very weak. By contrast, integration between Guangxi river-system prefectures and non-river-system prefectures in Guangdong is much more pronounced.

HEAT MAP 6 Interactions between Pearl River System and non-river-system prefectures, lowest prices of mid-grade rice. In overall, the color of heat map 6 is lighter than heat map 5, indicating the less strong integration of lowest prices. But the pattern of two heat maps are similar. Among the portions of the heat map 6, the lower-left region is the darkest, suggests that the integration of the river-system prefectures in Guizhou with the non-river-system ones in Guangdong is visibly stronger than other regions of this heatmap .
